Geraldo Braho
Synopsis No. Webinar 1
Due Date   01/20/2019

During the webinar we went through the syllabus and the materials we need for this course. Grad and undergrad students will be on the same class but in case there will be special work for grad students the professor will announce it.The book we will be using is Data mining (Concepts and Techniques). Other resources we may use are Dat camp , weka etc. By the end of the course we will have to do two research papers. The minimum passing grade for us is 66.

We briefly discussed about data mining. What data mining is ? So basically data mining means digging for information and nowadays everything is about data collections. Why data collections is important? By collecting data we will be able to train certain data set so we be able to get a conclusion out of it. In Data mining we have the KDD term(Knowledge data discovery).

Web conference was good and I hope that in the future we will be able to focus more in the application part of data mining. I would love to see hands on exercises during the webinar so we be able to understand better. I understand that the presentation part is important to inform us but it would be more beneficiary to do hands on examples.
